

HydroScum-SLIDE/P

USE

- Municipal and industrial water treatment plants
- Process water treatment plants
- Ponds
- Emergency tanks

PRODUCT DESCRIPTION

The „System HydroScum“ series has extraction devices equipped with pumps for floating matter or bacteria sludges on water surfaces. Thread-like bacteria that float easily influence the biological process e.g. in the form of bulking sludge and floating sludge. Using efficient, automatic separation of the bulking and floating sludge from the surface of aeration and post-treatment tanks, the activated sludge production is stabilised and thus the biological degradation process is optimised. The sedimentation process in post-treatment is significantly improved by the removal of bacteria that floats easily.

YOUR ADVANTAGES

- Extensive absorption of bulking and floating sludge from the surface
- Automatic selection via sensor-controlled, adjustable skim opening
- Crown bracket = simple installation on wall or crown brackets, thus ideal for retrofitting

HydroScum-Slide/P products are HST-WKS licensed products.
